Advantages of Tape Sealer over Plastic Tags

Material Cost Savings

Due to material content difference between the Plastic Tags and the Plastic Tape, significant cost savings can be made. In the many of cases the Tape Sealers can often pay for themselves over very quick periods and then save your company bulk sums in the future.

Print Quality Advantages

As the Tape seal is Electronic Printer friendly there are several advantages that can realised. The quality of print is significantly clearer and sharp Print Formats from a simple "Best Before" to a complex Batch trace-ability format are possible with text being applied both horizontally and vertically if required. All print formats can self chronologically update so that operators are not required to be responsible for correct point of tie information. The Electronic printers have memory that allows up to 150 Print Format to be stored to cater for all your customers' different requirements. As the Print information is applied to the tape seal within a guaranteed area, there is no requirement to print directly onto bags, removing the problems associated with this, i.e. unclear printing, positioning of the print onto bags, etc.

Safety Aspects

If accidentally swallowed, the seal will pass harmlessly through the digestive track causing no damage to a person's digestive track. Customers can stick the tape seal onto the bag, while removing product from the open bag, which assists with not losing the closure.

Pack Presentation

As the tape adheres to the bag neck, where it is applied by our automatic tape sealer, complete control of pack presentation can be achieved. This allows your production to control the pack tightness through adjustment of the in-feed settings, which are kept all the way though the supply route to your customers. This ensures a high quality product and reduces the possibility of product damage before your product reaches your customer.

Re-seal ability

The Tape Seal that our equipment applies is easy to open and can be resealed up to 200 times without tearing the bag or losing adhesion.

Seal Tightness

The diameter of the seal is controllable which allows both thin plastic bags and even thick paper bags to have a tight seal.

Production efficiencies

Due to the differences in the number of Seals per reel, i.e. 50,000 Tape Seals per reel versus around 2000 Tags per reel, the Plastic Tag applicator would need to change reels approx. 25 times for every 1 Tape Reel change.

Storage requirements

Due to the physical size of the tape seal, many thousands of seals fit onto one reel, i.e. up to 50,000 Seals per 4500 Meter Reel. This allows for considerably less storage space requirements and also less shipping costs per seal.
